

Annotation Guidelines for Illegal Content Detection

1. Legal Parameter Framework

The annotation process is grounded in the Indonesian Law Number 1 of 2024 (the second amendment to the Electronic Information and Transactions (ITE) Law). Every instance in the corpus is evaluated based on its potential to violate specific statutory definitions.

Legal Category	Statutory Basis (Law No. 1/2024)	Legal Interest Protected
Immoral	Article 27, Paragraph (1)	Public decency and moral values
Defamation	Article 27A	Individual honor and reputation
Threat	Article 27B, Paragraph (1) & (2)	Physical safety and material security
Hate Speech	Article 28, Paragraph (2)	Communal harmony and social stability

2. Observed Semantic Domains

Annotators must identify the primary Semantic Domain of the discourse. While a text may touch upon multiple themes, a single label must be assigned to the most prominent domain observed.

Semantic Domain	Observation Criteria
Pornography	Explicit textual representations of sexual acts or vulgar desires.
Gender	Content related to gender identity, sexual orientation, or gender-based social roles.
Nationality	Content regarding citizenship, country of origin, or national affiliation.
Neutral	General discourse that does not fall into specific sensitive or legal categories.
Ethnicity	Content concerning racial background, tribal identity, or ancestral heritage.
Religion	Content related to religious beliefs, practices, systems, or communal affiliations.

3. Illocutionary Force Identification (Searle’s Theory)

The framework operationalizes Searle’s Speech Act Theory to determine the communicative intent (illocutionary force) of an utterance. To ensure consistency in overlapping cases, annotators follow a hierarchical force priority.

Force Priority Hierarchy:
Declarative > Directive > Commissive > Expressive > Assertive

Illocutionary Force	Definition	Application in Illegal Content
Declarative	Utterances that change reality (e.g., official verdicts).	High-intensity legal implications (rare in social media).
Directive	Utterances intended to make the listener perform an action.	Incitement to violence or religious harassment.
Commissive	Utterances that commit the speaker to a future course of action.	Threats of physical harm or burning.
Expressive	Utterances that express the speaker's psychological state or attitude.	Defamatory insults and hate-filled attitudes.
Assertive	Utterances that commit the speaker to the truth of a proposition.	Claims or accusations regarding illegal acts.

4. Final Classification Priority Protocol (Triage Mechanism)

To maintain model scalability and resolve pragma-semantic boundary ambiguity, this research adopts a priority-based single-label protocol governed by a two-tier jurisprudential triage mechanism. The primary tier evaluates the statutory penalty severity under Law No. 1 of 2024, placing Defamation (maximum 2 years imprisonment) at the lowest priority. The secondary tier resolves the equivalence in maximum penalties (6 years imprisonment) among the Hate Speech, Threat, and Immoral categories by evaluating the macroscopic breadth of societal harm. Consequently, the established Classification Priority Hierarchy is Hate Speech > Threat > Immoral > Defamation.

- a. Rule: If a text contains both defamation against a person and hate speech against their religious identity, it is labeled exclusively as Hate Speech.
- b. Neutral Category: Applied only if no illegal force (based on ITE Law) is detected.

5. Annotator Training Protocol

To ensure inter-annotator reliability and a jurisdictionally aware "ground truth," the annotation process followed a structured calibration protocol:

- a. **Orientation:** Alignment on research goals and the 2017/2019 Indonesian political context to understand the sociocultural drivers of the polarized discourse.
- b. **Standardization:** Detailed mastery of the Annotation Guidelines, focusing on Law No. 1 of 2024, Searle's Speech Act Theory, and the Triage Priority mechanism (Hate Speech > Threat > Immoral > Defamation).
- c. **Supervised Annotation:** Initial formal labeling conducted under the oversight of the primary researcher to resolve remaining pragma-semantic ambiguities in real-time.
- d. **Independent Validation:** The final annotation phase enforces a strict partial double-annotation protocol:

- 1) Primary Annotation: The principal annotator executes the primary coding task on 100% of the dataset.
- 2) Blind Double-Annotation Scope: A secondary annotator independently evaluates a stratified sub-sample of 500 instances (exactly 100 instances per final classification category). The annotation interface strictly masks the primary annotator's preliminary labels and the origin of the data (authentic vs. augmented).
- 3) Augmented Data Human-in-the-Loop Evaluation: For minority classes containing fewer than 100 empirical instances, synthetic texts generated via the augmentation pipeline are injected to fulfill the stratification quota. This mandates a blind human quality assessment of the synthesized lexical variations.
- 4) Disagreement Resolution: Labeling discrepancies identified within the 500-instance validation subset are extracted and resolved through a consensus adjudication session involving a third independent linguistic expert.
- 5) Reliability Metrics: Post-adjudication, the structural stability of the pragma-semantic framework is formally quantified using Cohen's Kappa and per-category F1-agreement scores.

6. Decision Tree for Illegal Content Annotation
